Advantages of using hair as biopsy material

Advantages of using hair as biopsy material

- Higher concentrations
- Longer diagnostic window
- Hair is of premium forensic value due to its high keratin content
- Hair can be collected under close supervision

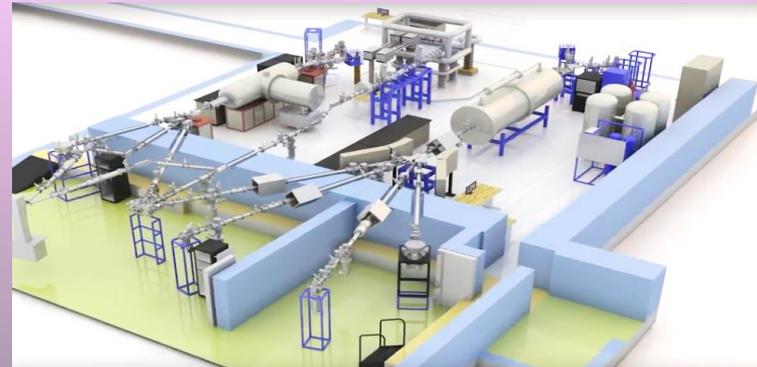

Techniques

When performing hair analysis - **assessment of analytical capabilities + sample preparation methodology** critical:

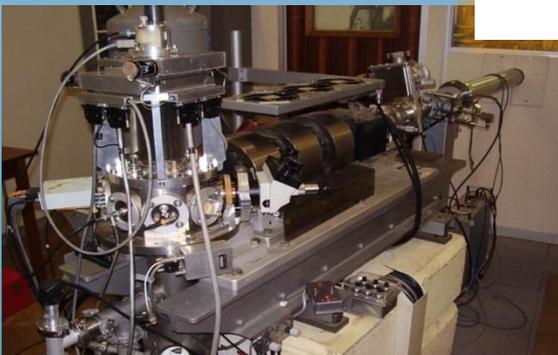

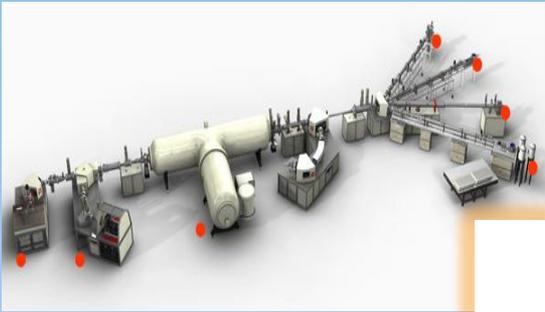

- Bulk processing destroy spatial information
- Extraction methods may not be optimized

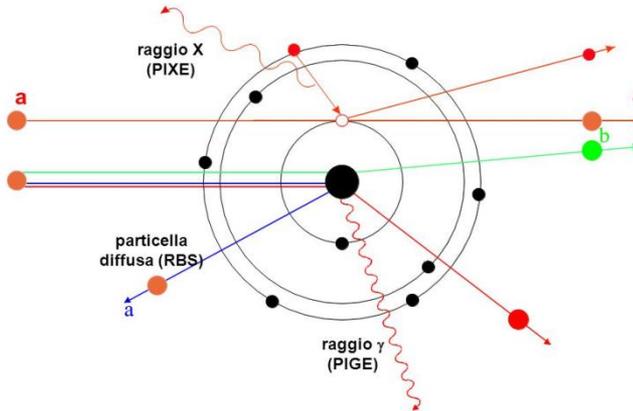

- Versatile techniques: **ion beam techniques**
 - **PIXE**
- Secondary ion mass spectrometry (**MeV-SIMS**)

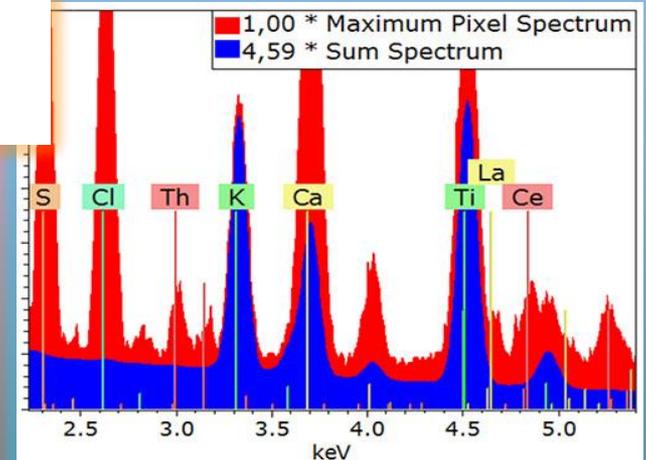

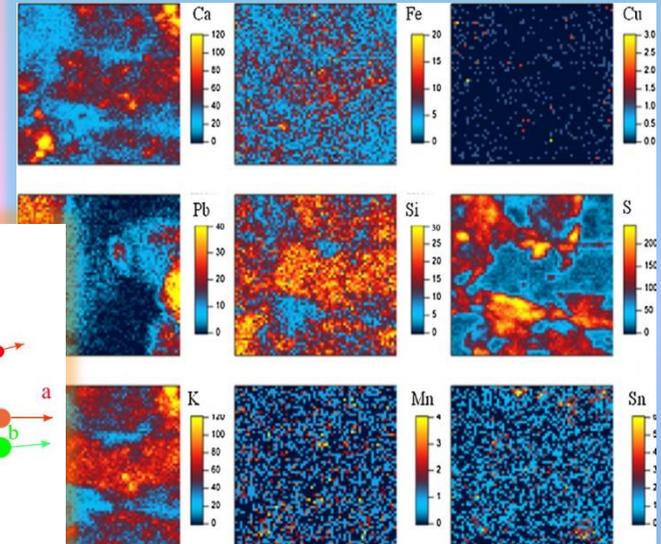

Technical aspects

Ion Beam Analysis - Il principio

Results

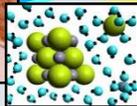

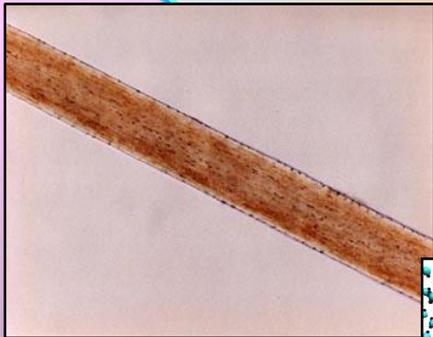

Aims

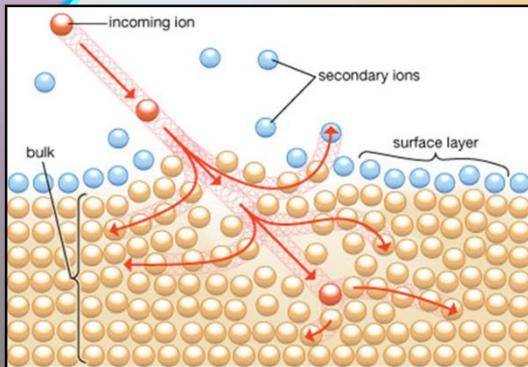

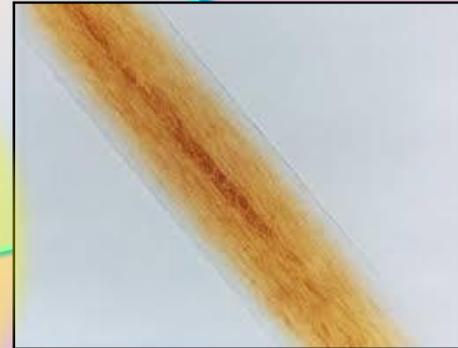

**In-air PIXE:

COMMUNICATION

1 Detection of lithium in scalp hair by time-of-flight secondary ion mass spectrometry with high energy (MeV) primary ions

Karen J. Cloete,* Boštjan Jenčič, Žiga Šmit, Mitja Kelemen, Kwezikazi Mkentane and Primož Pelicon

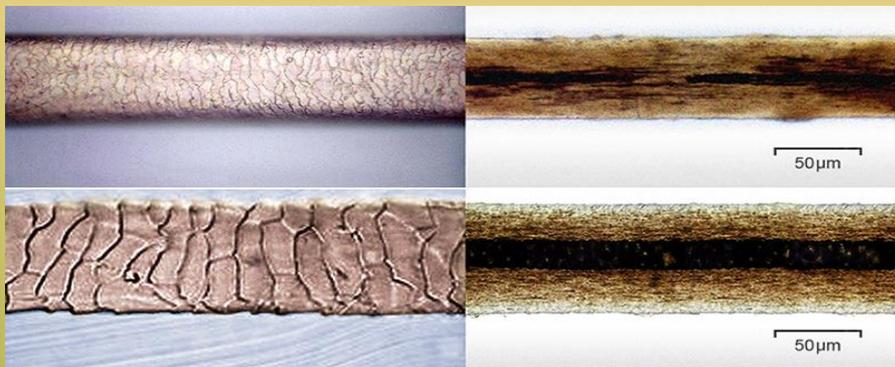

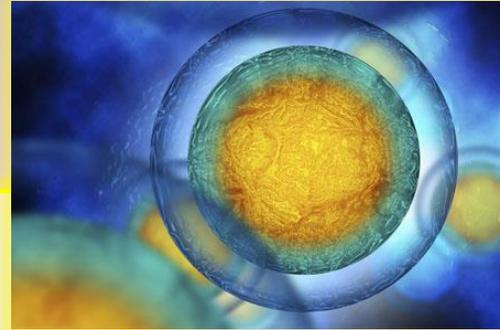

The application of MeV-SIMS is presented for the detection and mapping of lithium in chemically unprocessed, longitudinally sectioned scalp hair.

MeV-SIMS

- **Detection sensitivity and speed**
- **Conventional analysis methods traditionally used**
- **Chemical processing**
- **Destroys historical and spatial information**
- **Low recoveries trace elements**

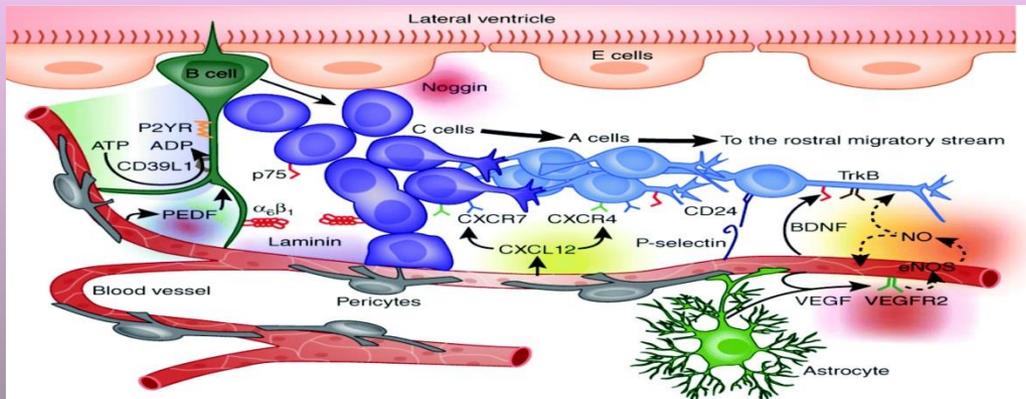

Lithium

- Li may enter biological tissues via food

- No apparent vital physiological function, nutritional trace element multifactorial biochemistry in body

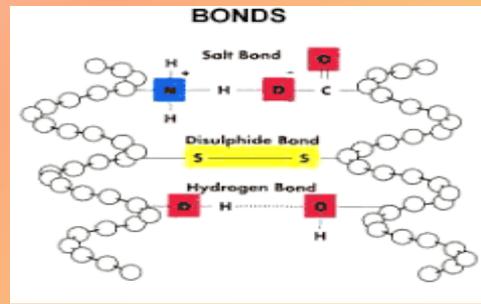

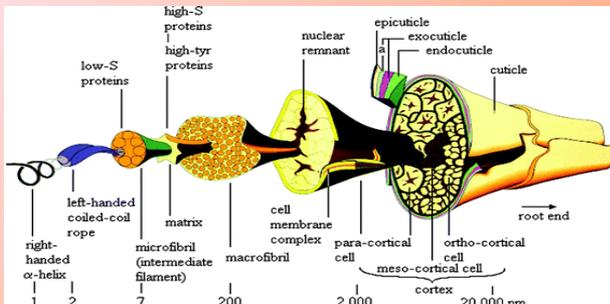

- Psychopharmacuetical

- Alkaline hair straightener or no-lye relaxer emulsions

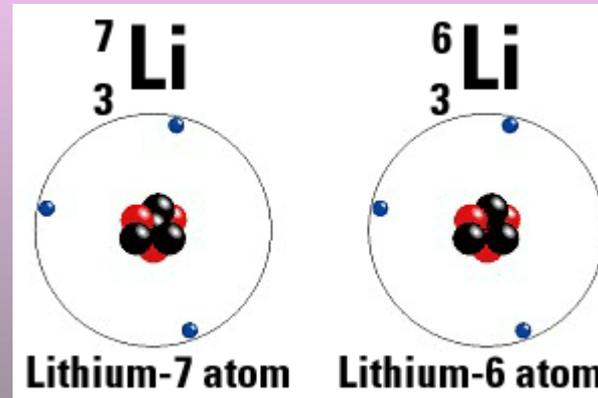

- Use of hair relaxers popular in certain cultures
- Damage hair

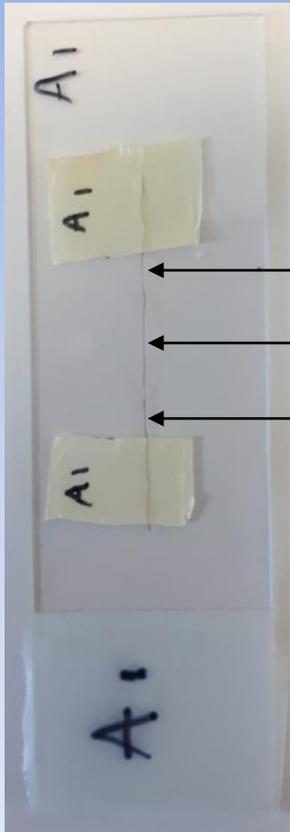

Lithium

- External vs internal origin
- Binding to hair chemical components
- Li isotopes?
- Transfer to new growth

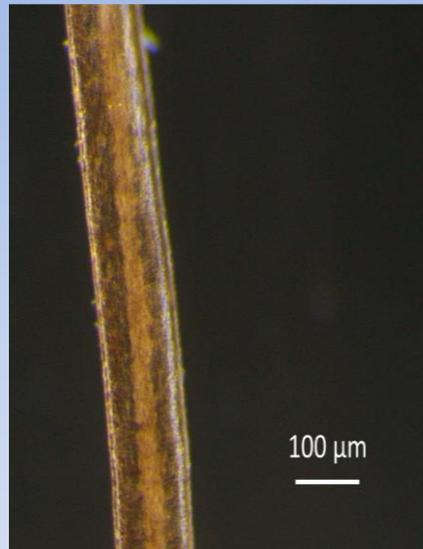

Sample preparation
